Critical review

What impresses

- The scene reads as a real tactical sequence, not just objects placed on a canvas.
- The field stays complete, and the fit no longer breaks when playback starts.
- Persistence after reload gives the demo production credibility.
- Roles and labels are readable enough for a coaching audience to follow the action.

What feels amateur

- The header still has too many competing controls, which makes the presentation feel busy.
- The side rails still look like an editor, not a polished demo mode.
- Some vector assets remain placeholder-like compared with a premium product feel.
- The story relies more on motion than on editorial emphasis and tactical narration.

What I would improve

- Introduce a presentation mode with fewer visible controls and a single dominant CTA.
- Strengthen the visual contrast between carrier, receiver and support runs.
- Simplify the inspector for presentation, and reserve detailed controls for edit mode.
- Add phase labels or subtle editorial callouts so the sequence is understood instantly.

What I would change completely

- I would separate demo presentation from authoring. Right now the product is functional, but a teaching/demo version should hide most of the construction affordances and put the tactical story first.
